RELATIONSHIP BETWEEN THE CHARACTERISTICS OF PURSE-SEINE VESSELS AND  
FISHING MORTALITY (PROJECT J.2.a): PROGRESS REPORT

Jon Lopez, Cleridy E. Lennert-Cody, Mark N. Maunder and Ernesto Altamirano

SAC-10-10

10<sup>th</sup> Meeting of the Scientific Advisory Committee San Diego, California USA, 13-17 May 2019

# Background

- Purse-seine fleet **effort continuous to increase** in the eastern Pacific Ocean (EPO), which requires more stringent management measures.
- However **extending the closures** of the fishery is difficult.
- **Additional measures** have been tried as alternatives in the past.
  - Catch limits by set type in 2017, and limiting the number of active FADs per vessel in 2018.
- Nevertheless, the current tuna conservation measures (Resolution C-17-02) may not be as effective as desired, and **new and different measures may be required**.
- As such, the staff has recently received a growing number of requests for further analyses of **alternative management measures**.
- Also, using vessel well volume as the measure of fleet capacity is somewhat simplistic, and a **more precise measure of capacity** needs to be quantified.
- Therefore, a full-time researcher was hired in early 2018 for two years to address six related questions that were grouped into **one project (J.2.a)**.

# Background - Tasks

- Project J.2.a responds to a series of management-related research requests recently made to the IATTC staff:

1. Evaluate...
  2. Invest...
  3. Evaluate...
  4. Invest...
  5. Invest...
  6. Evaluate...
- WG-FADs).

**DEVELOPING ALTERNATIVE CONSERVATION MEASURES FOR BIGEYE TUNA IN  
THE EASTERN PACIFIC OCEAN: A DYNAMIC OCEAN MANAGEMENT APPROACH**

Jon Lopez, Cleridy E. Lennert-Cody, Mark N. Maunder, Haikun Xu, Stephanie Brodie, Michael Jacox, Jason Hartog

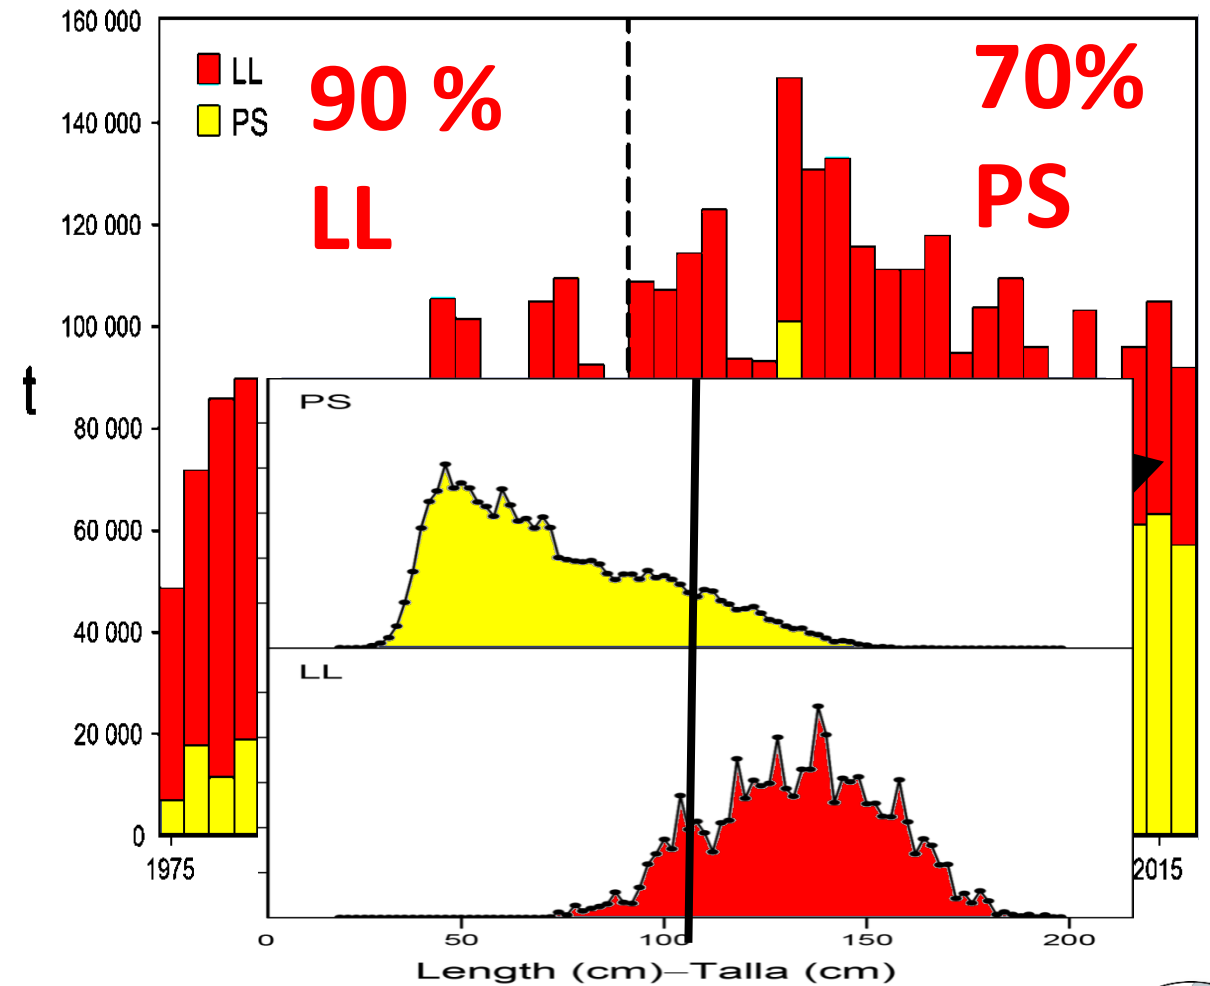

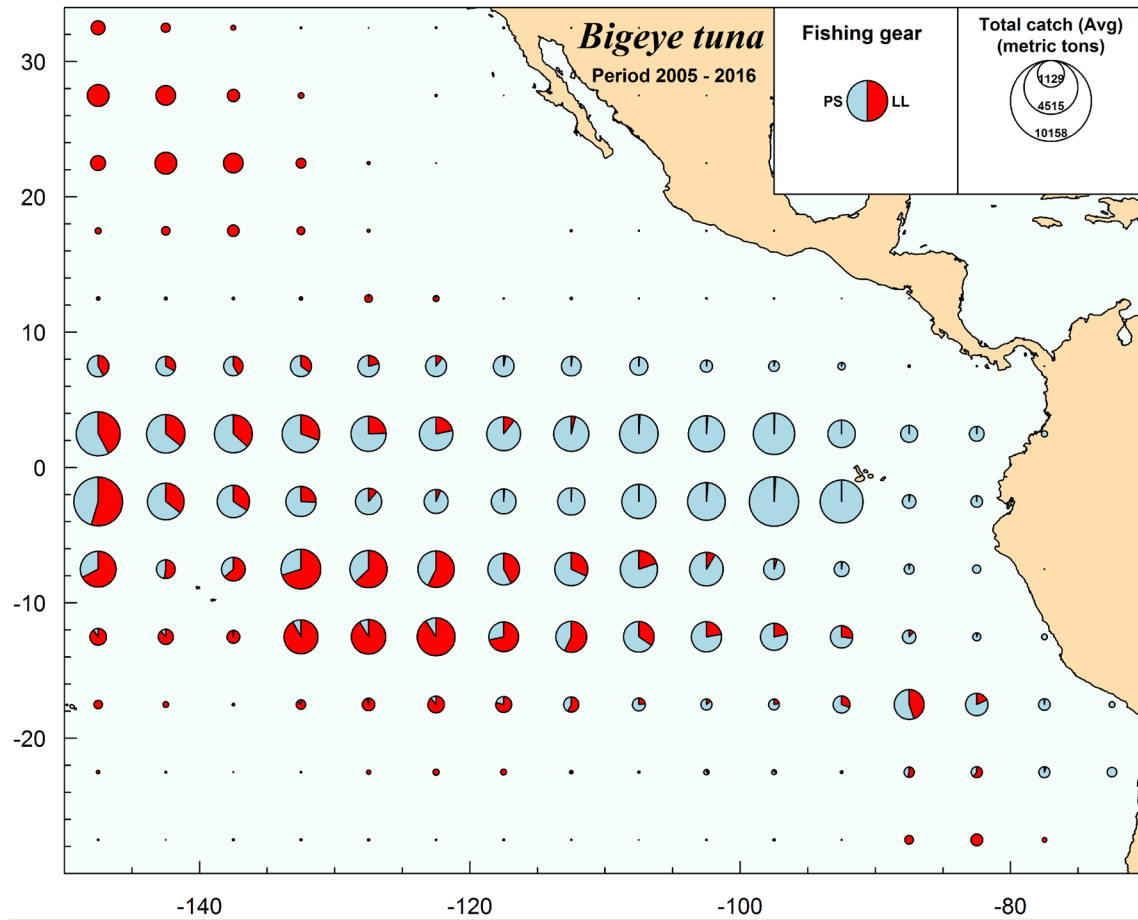

SAC-10-INF-D

10<sup>th</sup> Meeting of the Scientific Advisory Committee San Diego, California USA, 13-17 May 2019

# Background

# Background

# Background

## Conservation measures in force

- Res. 17-02 [plan for 2018-2020]
- 72 days closure
- 30 days additional closure (Oct-Nov)

## Staff proposal to maintain/reduce F:

- Limit the **number of sets** (FOB+Una)
- Project  $F_{\text{mort}}$ 
  - Operational characteristics vs F
  - Automatic set classification
  - **BET DOM**

*Little is known on BET preferred habitat in the EPO.*

Figure 1. Closure area

# Data and methods

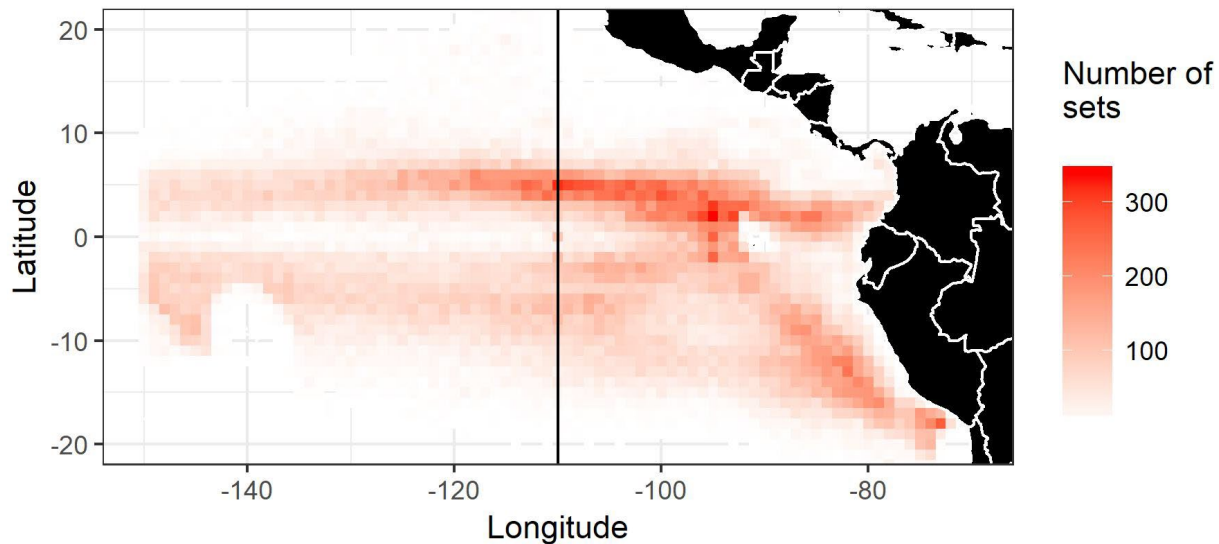

## FISHERIES DEPENDENT DATA

Purse seine observer data (1995-2017)

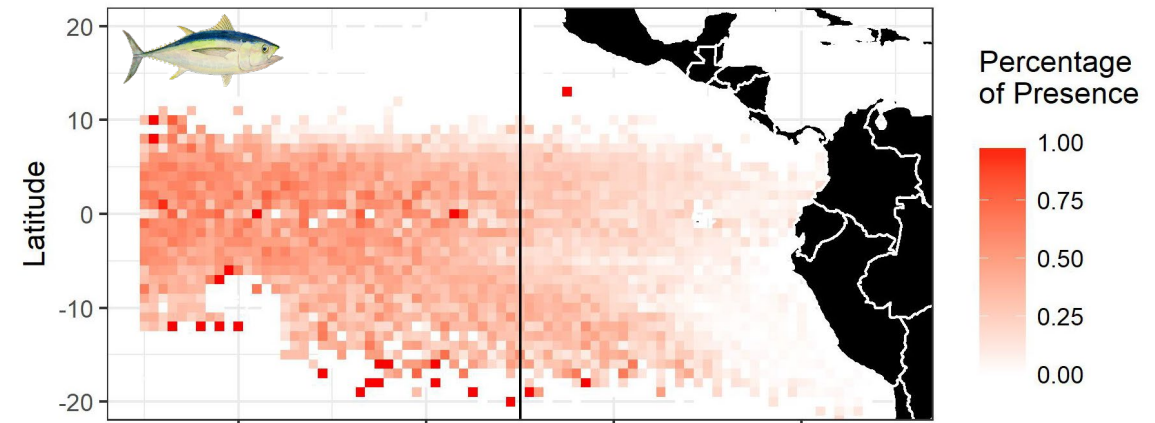

~450,000 fishing sets

~150,000 FOB sets (~50% positives)

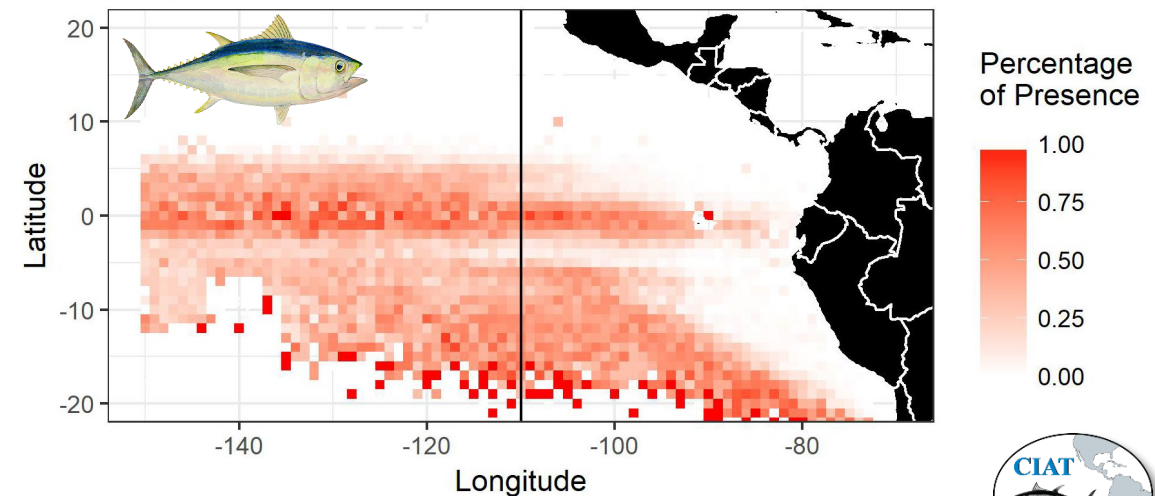

OBJ sets (2000-2017)

Small BET (<2.5kg; <46cm(age1)) present

Large BET (>15kg; >86cm(age2))

# Data and methods - Variables

# Conclusions

- We present the basis to develop a **dynamic ocean management** tool for BET in the EPO.
- Next step would be to **make the tool operational**.
- Ideally similar models should be established for **SKJ and YFT** and weight outputs based on users preference-needs.
- **Different possibilities** exist:
  - Provide maps to the fleet in **near real time** to make fishery more selective, both catch-restricted or unrestricted.
  - **Adaptive closures** (e.g. weekly, monthly, seasonal)
- **OBJ depth and Net Depth** may have implications on juvenile BET and YFT catch rates. However, hard to extract definitive conclusions for management due to spatial correlation particularly for Net depth and OBJ epibiota (e.g. deeper nets are used in the western area).
